# Outline

#### Orthogonal polynomials

- Properties of classical orthogonal polynomials
- Quasi-orthogonality and semiclassical orthogonal polynomials
- 4 The hypergeometric function
- 5 Convergence of Padé approximants for a hypergeometric function
  - Padé approximation
  - Padé approximant for  $_2F_1(a, 1; c; z)$
  - Poles of the Padé approximant
  - Convergence in the Padé table

A formal power series is an expression

$$f(z) = \sum_{j=0}^{\infty} a_j z^j, \; a_j \in C, \; j = 0, 1, 2, 2, \dots$$

◆□ > ◆□ > ◆臣 > ◆臣 > ○

A formal power series is an expression

$$f(z) = \sum_{j=0}^{\infty} a_j z^j, \ a_j \in C, \ j = 0, 1, 2, 2, \dots$$

For an integer  $\ell \geq 0$ , we write

$$f(z)=O(z^\ell)$$

if  $a_0 = a_1 = a_2 = \ldots = a_{\ell-1} = 0$ .

The [m/n] Padé approximant for a formal power series

$$f(z) = \sum_{k=0}^{\infty} t_k z^k$$

is a rational function

$$\frac{P_{mn}(z)}{Q_{mn}(z)} := \left[\frac{m}{n}\right](z)$$

of type (m, n) such that

$$f(z)Q_{mn}(z) - P_{mn}(z) = O(z^{m+n+1})$$

as  $z \rightarrow 0$ .

The Padé approximant is a rational function  $P_{mn}(z)/Q_{mn}(z)$  that agrees with f(z) up through order m + n.

The name comes from Henri Eugene Padé, a student of Hermite, who completed his thesis in 1892, but the approximant goes back to Cauchy and Jacobi.

#### Theorem

Let f(z) be a formal power series.

Then  $\forall m, n \geq 0$ ,

$$\left[\frac{m}{n}\right](z) = \frac{P(z)}{Q(z)}$$

exists and is unique.

<ロ> (四) (四) (三) (三) (三)

#### Theorem

Let f(z) be a formal power series.

Then  $\forall m, n \geq 0$ ,

$$\left[\frac{m}{n}\right](z) = \frac{P(z)}{Q(z)}$$

exists and is unique.

Further, if after cancelling common factors in P and Q, we obtain

$$[m/n] = \hat{P}/\hat{Q},$$

then  $\hat{Q}(0) \neq 0$  and

$$f(z) - [m/n](z) = O(z^{m+n+1-\ell}),$$

where

$$\ell = \min\left\{n - \deg \hat{Q}, m - \deg \hat{P}\right\}.$$

Then

$$(fQ - P)(z) = O(z^{m+n+1})$$
 (3)

$$(fQ_1 - P_1)(z) = O(z^{m+n+1}).$$
 (4)

・ロン ・雪 ・ ・ ヨ ・ ・ ヨ ・ ・

Then

$$(fQ - P)(z) = O(z^{m+n+1})$$
 (3)

$$(fQ_1 - P_1)(z) = O(z^{m+n+1}).$$
 (4)

Then (3)  $imes Q_1(z) - (4) imes Q(z)$  :

$$P_1(z)Q(z) - P(z)Q_1(z) = O(z^{m+n+1}).$$
(5)

▲御★ ▲注★ ▲注★

Then

$$(fQ - P)(z) = O(z^{m+n+1})$$
 (3)

$$(fQ_1 - P_1)(z) = O(z^{m+n+1}).$$
 (4)

Then (3)  $\times Q_1(z) - (4) \times Q(z)$ :

$$P_1(z)Q(z) - P(z)Q_1(z) = O(z^{m+n+1}).$$
(5)

Since  $P_1(z)Q(z) - P(z)Q_1(z)$  is a polynomial of degree  $\leq m + n$ , and (5) tells us that this polynomial has a zero at the origin of order (m + n + 1), it follows that

$$P_1(z)Q(z) - P(z)Q_1(z) \equiv 0$$

or

$$P(z)/Q(z) \equiv P_1(z)/Q_1(z),$$

so [m/n](z) is unique.

3

Consider [m/n] = P/Q and assume that we can write, for some non-negative integer r with  $r \le m$  and n, and some polynomial S, that

$$P(z) = z^{r} S(t)\hat{P}(z)$$
$$Q(z) = z^{r} S(t)\hat{Q}(z)$$

where  $S(0) \neq 0$  and  $\hat{P}$ ,  $\hat{Q}$  have no common factors.

< 回 > < 注 > < 注 > … 注

Consider [m/n] = P/Q and assume that we can write, for some non-negative integer r with  $r \le m$  and n, and some polynomial S, that

$$P(z) = z^r S(t)\hat{P}(z)$$
$$Q(z) = z^r S(t)\hat{Q}(z)$$

where  $S(0) \neq 0$  and  $\hat{P}$ ,  $\hat{Q}$  have no common factors.

Since

$$z^r S(z)((f \hat{Q}(z) - \hat{P}(z))) = (fQ - P)(z) = O(z^{m+n+1}),$$

we can multiply by  $\frac{1}{S(z)}$  since  $S(0) \neq 0$  to deduce  $z^r(f\hat{Q} - \hat{P})(z) = O(z^{m+n+1})$  which means

$$(f\hat{Q} - \hat{P})(z) = O(z^{m+n+1-r})$$
 (7)

▲御 → ▲ 臣 → ▲ 臣 → 二 臣

We now claim that  $\hat{Q}(0) \neq 0$ :

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

We now claim that  $\hat{Q}(0) 
eq 0$ :

If  $\hat{Q}(0) = 0$ , since  $r \leq n$ , (7) shows that  $\hat{P}(0)$  is also zero.

Then  $\hat{P}$  and  $\hat{Q}$  have a common factor namely z, a contradiction. So  $\hat{Q}(0) \neq 0$ .

□ > < ∃ >

★ 문 ▶ 문

We now claim that  $\hat{Q}(0) \neq 0$ : If  $\hat{Q}(0) = 0$ , since  $r \leq n$ , (7) shows that  $\hat{P}(0)$  is also zero. Then  $\hat{P}$  and  $\hat{Q}$  have a common factor namely z, a contradiction. So  $\hat{Q}(0) \neq 0$ .

Thus we can multiply (10) by  $1/\hat{Q}(z)$  to obtain

$$f(z) - rac{\hat{P}(z)}{\hat{Q}(z)} = 0(z^{m+n+1-r}).$$

Finally, from (6),

$$m \geq \deg(P) = r + \deg(S) + \deg(\hat{P})$$
  
 
$$\geq r + \deg(\hat{P}), \text{ so that}$$

$$r \leq m - \deg(\hat{P})$$
. Similarly,  $r \leq n - \deg(\hat{Q})$ , so if  
 $\ell = \min\left\{n - \deg(\hat{Q}), m - \deg(\hat{P})\right\}$ , we have  $r \leq \ell$ . Hence  
 $m + n + 1 - r \geq m + n + 1 - \ell$ 

and

$$f(z) - [m/n](z) = O(z^{m+n+1-\ell}).$$

## Padé table

The [m/n] Padé approximants for f can be arranged to form the Padé table of f.

Notice that the first column of the table is the sequence of partial sums of  $f(z) = \sum_{j=0}^{\infty} a_j z^j$ .

$$[m/0] = \sum_{j=0}^m a_j z^j$$

A Padé approximant is normal if it occurs only once in the Padé table.

The Padé table is normal if each entry in the table is normal.

< ≣ >

The Padé table has a special structure.

### Theorem (Padé)

The Padé table of a formal power series f(z) consists of square blocks of size  $r, 1 \le r \le \infty$ , for which

- (a) All elements in a square block are identical;
- (b) No other entries in the Padé table of f are the same as elements in this block;
- (c) If  $[\hat{m}/\hat{n}] = \hat{P}/\hat{Q}$  is the top left hand corner of a square block, then  $deg(\hat{P}) = \hat{m}, \ deg(\hat{Q}) = \hat{n}, \ Q(0) \neq 0$  and if  $r = \infty$ ,

$$f(z)-[\hat{m}/\hat{n}](z)\equiv 0$$

i.e. f is a rational function.

We do not have a closed form for the numerator polynomial of the Padé approximants for  ${}_2F_1(a, 1; c; z)$  so we do not know where the zeros of the approximant lie. The numerator polynomial  $P_{mn}(z)$  is determined by

$$f(z)Q_{mn}(z) - P_{mn}(z) = 0(z^{m+n+1})$$

since  $Q_{mn}(z)$  is known.

For m = n - 1,  $P_{mn}(z)$  is the polynomial we obtain from the first (m + 1) terms in the product

$$_{2}F_{1}(a, 1; c; z) _{2}F_{1}(-n, -a - m; -c - m - n + 1; z)$$

伺下 イヨト イヨト

### The numerator polynomial

Thus

$$P_{mn}(z) = \sum_{r=0}^{m} \sum_{l=0}^{r} \frac{(a)_{r-l}(-n)_{l}(-a-m)_{l}}{(-c-m-n+1)_{l}(c)_{r-l}l!} z^{r}$$

for  $0 \leq r \leq m$ .

・ロン ・雪 ・ ・ ヨ ・ ・ ヨ ・ ・

### The numerator polynomial

Thus

$$P_{mn}(z) = \sum_{r=0}^{m} \sum_{l=0}^{r} \frac{(a)_{r-l}(-n)_{l}(-a-m)_{l}}{(-c-m-n+1)_{l}(c)_{r-l}/!} z^{r}$$

for  $0 \leq r \leq m$ .

### Example

For a = 2, c = 6, m = 3 and n = 4,

$$P_{34}(z) = 1 - \frac{4}{3}z + \frac{344}{693}z^2 - \frac{1}{22}z^3$$

which is not equal to  ${}_{2}F_{1}(-3, \alpha; \beta; z)$  for any  $\alpha, \beta$ .
